Name	: Mrs C Lakshmi	Specimen	: BODY TISSUE
Age / Sex	: 40 Year(s) / Female	Visit Type	: IP
Sample No	: M22109030001	Collected On	: 03/09/2021 09:37 AM
Consulting DR	: Drs Sanjay Goja/ Manoj Singh/Varun Mahabaleshwar/Raghavendra	Referred DR	: Dr.Drs Sanjay Goja/ Manoj Singh/Varun Mahabaleshwar/Raghavendra
Patient Address	: 1/96A1, N.B Agraharam Krishnagiri Hosur Tamil Nadu, India	Received On	: 03/09/2021 10:42 AM
		Reported On	: 07/09/2021 01:29 PM
		Report Type	: Final

HISTOPATHOLOGY

REGULAR HP EXTRA LARGE BIOPSY

Lab No	H-4866/2021.
Specimen details	Liver.
Clinical Details	Cryptogenic chronic liver disease. Cirrhosis liver, thick walled gallbladder.
Gross Examination	<p>Received an explant liver specimen weighing 851.0 grams and measuring 22.0 x 14.0 x 7.0 cm. The outer surface shows micro nodules. Serial sectioning shows entire liver with micro nodules. No focal lesions are not identified. The attached gallbladder measuring 6.0 x 4.0 cm it is distended and filled with bile fluid. The gallbladder wall measures 0.3 cm in thickness, the mucosa is velvety. No stones are identified.</p> <p>Representative sections processed in capsules in :</p> <p>BLOCK CODES : A to H : Random from liver. J and K : Gall bladder. L : Cystic duct resected end.</p> <p>Grossed by Dr. Shaesta N.Z.</p>

HISTOPATHOLOGY

Microscopy

The liver shows loss of architecture and vascular relationship There is diffuse nodule formation with surrounding bridging fibrosis, which is consistent with cirrhosis.

The hepatocytes show some swelling. There is minimal hepatocellular, canalicular and bile ductular cholestasis. There are patchy foci of mixed inflammatory cells in the lobules.

Steatosis is minimal and patchy (less than 1.0% of hepatocytes).

The fibrous septa show ductular reaction with patchy sparse inflammation. Native bile duct branches are seen.

The reticulin stain shows loss of normal architecture with loss of central vein and presence of double cell plates. No Periodic acid Schiff Diastase positive cytoplasmic globules are seen in the hepatocytes. The reticulin and iron show no abnormal staining pattern. There is no evidence of granuloma or malignancy.

- Sections show gallbladder wall with mucosa showing mild chronic inflammatory infiltrate. There is no evidence of dysplasia or invasive carcinoma.

Impression

Explant liver :

- Chronic liver disease with established Cirrhosis.
- Negative for malignancy.

Gall bladder :

- Chronic cholecystitis.
